11 Experiment: Deploying a Zoho Creator Application to Production

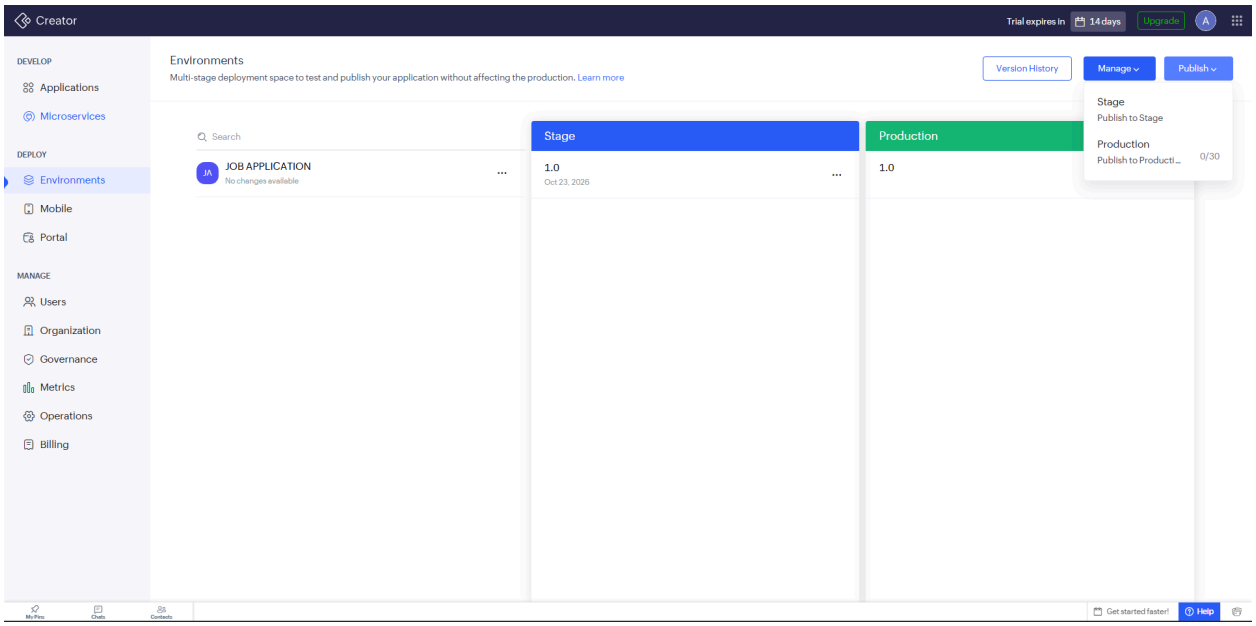

Aim

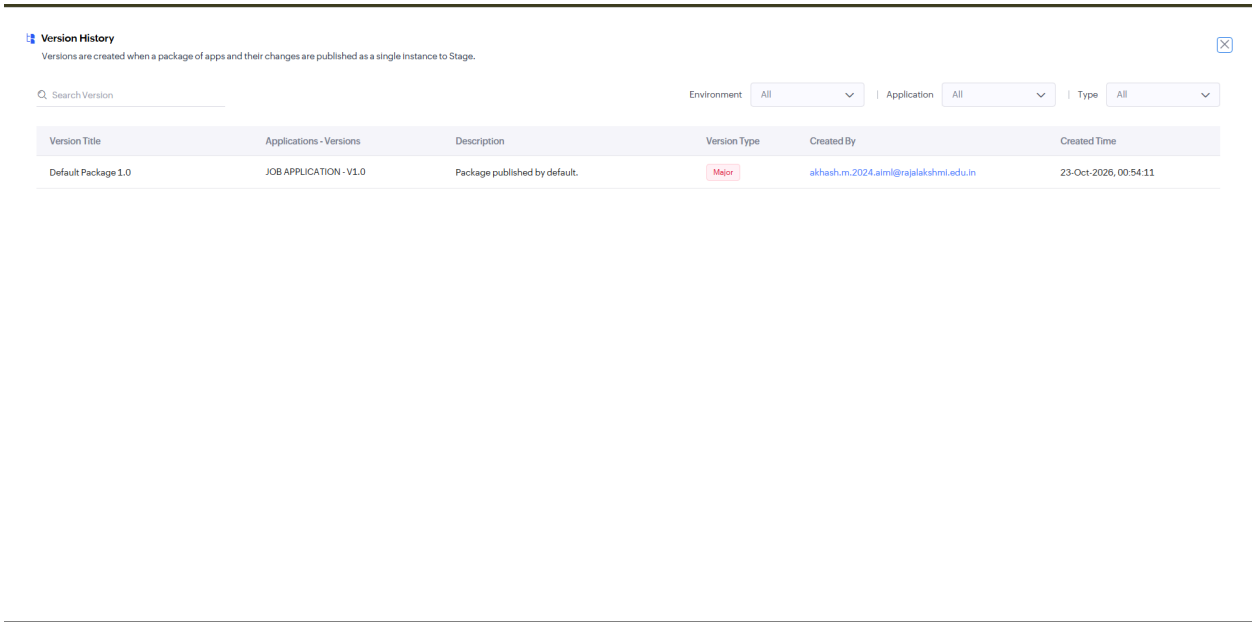

To deploy a Zoho Creator application to the production environment by configuring application settings, testing its functionality, setting user permissions, and publishing it for end users.

Procedure

- 1. Log in to Zoho Creator: Open the Zoho Creator website and sign in using your account credentials.
- 2. Open the application: Select the application that needs to be deployed to production.
- 3. Test the application: Check all forms, reports, pages, workflows, and Deluge scripts to ensure they function correctly.
- 4. Configure application settings: Verify the application name, required fields, data validation rules, and other settings.
- 5. Set user permissions: Configure user roles and access permissions for administrators, developers, and end users.
- 6. Configure data access: Ensure that users can view, add, edit, or delete records according to their assigned permissions.
- 7. Publish the application: Open the application's deployment or publishing options and follow the available steps to make it accessible to the intended users.
- 8. Share the application: Provide access to authorized users through the appropriate application link or invitation.
- 9. Verify production functionality: Open the published application and test form submission, report generation, workflows, and user access.
- 10. Monitor the application: Check for errors and ensure that the application operates correctly after deployment.

- 11. Check deployment status: Confirm that the application is published successfully and is available in the production environment. Zoho Creator supports a Development → Stage → Production workflow for controlled deployment.

Result

The Zoho Creator application was successfully deployed to the production environment. The application was tested, user permissions were configured, and its forms, reports, and workflows were verified for use by authorized users.
